

**ABSTRACT**  
**A DRAINAGE ASSEMBLY**

5 A drainage assembly (10) comprises a frame (11) for defining at least part  
of the surface boundary of a surface drainage aperture; and a grating (14)  
having formed therein a plurality of apertures. The grating (14) is hingedly  
secured to the frame (11) and is moveable, when so secured, between an  
operative position in which the grating (14) is contiguous with the frame  
(11); and an open position in which the grating (14) lies hinged away from  
10 the frame (11).

15 The grating (14) includes protruding therefrom a pair of forks (34, 36). The  
frame (11) includes a pair of journal bearings (37, 38). The forks each have  
protruding therefrom a respective protuberance (39) that is receivable in a  
respective journal recess (42) formed in the journal bearings.

20 At least one of the said forks (34, 36) is resiliently deformable and the  
locations of the respective protuberances (39) and journal recesses (42) are  
such as to urge the said protuberances (39) into associated said journal  
recesses when the grating (14) and the frame (11) are secured together.
